Create and configure main.py

Slide 1 – Create and Configure `main.py`

Legal Ease: AI-Powered Legal Document Generator

- `main.py` is the main entry point of the FastAPI backend.
- It initializes the FastAPI application.
- It defines the home route.
- It connects the application with `routes.py`.
- It manages the backend API structure.

Slide 2 – Initialize FastAPI App

FastAPI Application Setup

- Import the FastAPI framework.
- Create the FastAPI application instance.
- Configure the application for API requests.
- Set the application title and basic settings.
- Prepare the backend to handle HTTP requests.

Example:

```
from fastapi import FastAPI

app = FastAPI(

    title="Legal Ease API"

)
```

Slide 3 – Create Home Route `/`

Home Route

- Create a basic route using `/`.
- The route confirms that the backend is running.
- It responds to a GET request.
- Useful for basic API testing.

Example:

@app.get("/")

def home():

return {"message": "Legal Ease API is running"}

Slide 5 – Include Router

Connecting Routes

- Use `include_router()` to connect `routes.py`.
- All defined API endpoints become available.
- The `/generate` endpoint can be accessed through the router.
- Separates application setup from API logic.

Example:

```
app.include_router(router)
```

lide 6 – Final `main.py` Structure

Complete Configuration

```
from fastapi import FastAPI
from routes import router

app = FastAPI(title="Legal Ease API")

@app.get("/")
def home():
    return {"message": "Legal Ease API is running"}

app.include_router(router)
```
