Research and select the model

Slide 1: Definition & Research Criteria

Headline: Establishing the Evaluation Framework

- **Objective:** Define what we need the model to achieve and outline our research scope.
- **Core Requirements:**
  - **Performance Metrics:** Accuracy thresholds, error margins, and latency boundaries.
  - **Resource Constraints:** Budget limits, computational power, and deployment timelines.
- **Research Sources:** Literature reviews, benchmarking databases, and internal pilot data.

Slide 2: Model Options & Benchmarking

Headline: Evaluating Candidates Against Key Metrics

- **Candidates Identified:**
  - **Model A (Baseline):** Highly stable, lower complexity, lower relative performance.
  - **Model B (Advanced):** High accuracy, intensive processing needs, higher setup cost.
  - **Model C (Niche/Specialized):** Perfectly fits specific criteria but limits scalability.
- **Performance Overview:** (Placeholder for a comparative matrix)

Slide 3: Selection Trade-Off Analysis

Headline: Balancing Priorities to Find the Optimal Solution

- **Key Trade-Offs:**
  - **Speed vs. Accuracy:** Finding the tipping point where model delay degrades user experience.
  - **Cost vs. Capability:** Evaluating the return on investment for more expensive models.
- **Risk Management:** Identifying data dependencies, edge-case vulnerabilities, and mitigation strategies.

Slide 4: Final Selection & Implementation Plan

Headline: The Chosen Model and Next Steps

- **Selected Framework: [Insert Model Name Here]** chosen for its balance of cost and precision.
- **Justification:** Met 100% of non-negotiable criteria and demonstrated the best scalability during benchmarking.
- **Next Steps:**
    - **Phase 1:** Environment setup and initial data ingestion.
    - **Phase 2:** Hyper parameter tuning and validation tests.
