main.py & API Logic

Slide 1 – main.py Overview

main.py & API Logic

- `main.py` is the main backend file.
- It contains the FastAPI application logic.
- It defines API endpoints and request handling.
- It connects user requests with the Gemini AI service.
- It returns the generated legal document to the frontend.

Slide 2 – FastAPI Application Setup

Creating the FastAPI App

- Import FastAPI and required libraries.
- Create the FastAPI application instance.
- Configure the application for API requests.
- Define routes for different operations.
- Run the application using a server such as Uvicorn

Slide 3 – `/generate` API

Document Generation Endpoint

- Endpoint: **`POST /generate`**
- Receives legal document information.
- Accepts:
  - `document_type`
  - `parties`
  - `terms`
  - `dates`
- Processes the received data.
- Sends the request for AI-based generation.

Slide 4 – API Request & Validation

Handling User Input

- Receive JSON data from the frontend.
- Validate required fields.
- Check whether the input is complete.
- Prepare the data for Gemini.
- Handle invalid or missing inputs safely.

Slide 5 – Gemini API Logic

AI Document Generation

- Create a prompt using the received information.
- Send the prompt to Gemini.
- Gemini generates the required legal document text.
- Receive the AI-generated response.
- Return the generated text through the API.

Slide 6 – Response & Error Handling

API Response

- Return generated document text as JSON.
- Handle API or server errors.
- Provide meaningful error messages.
- Keep API credentials secure.
- Test the endpoint with different document types.
